EXAMPLE DATA — FICTIONAL DEMO CASE FOR BATATIS — NOT A REAL PROJECT, PRODUCT, PERSON, TEST OR APPROVAL

Project brief: EPW NailBase CI-50 pilot house

From: Mira Okafor, Technical Director, Example Panel Works Ltd. *(fictional)* **Date:** 2026-10-12
To: "whoever approves building products in Alberta"

What we want

Our panel is selling in two other provinces *(claim not verified)*. We want **approval to sell it across Alberta** and a first **pilot house** in Edmonton this spring. Builders love it because vinyl siding nails **straight into the facer**, so there's no OSB and no strapping.

The product (see the data sheet)

- 50 mm rigid foam core with a 6 mm fibre-cement nail-base facer, factory-bonded. No wood content.
- Shiplap edges. We tape the joints with our own tape.
- Replaces 11 mm OSB on 2×6 walls at 400 mm o.c.

Pilot house

Item	Detail
Builder	Birchfield Example Homes *(fictional)*, contact Dev Rahman
Owner	"The buyer, not decided yet". Builder-owned spec home until sale
Address	0000 Example Way NW, Edmonton, AB *(fictional)*
Legal description	*Don't have it*
Permit #	*Not applied yet*
Building	2-storey single-family, about 190 m², unsprinklered, HRV planned
Wall, inside to out	12.7 mm gypsum, poly, 2×6 studs with batts, **NailBase CI-50**, housewrap? (*maybe not needed*), vertical vinyl siding nailed to facer

What we have

1. Product data sheet (ours)
2. Permeance test summary from a lab in the US *(EXAMPLE)*
3. Draft letter from our consulting engineer about nail pull-out *(EXAMPLE, not signed yet)*
4. In-house wind-load pull-out tests (spreadsheet, not attached)

What we don't have yet

- Any CCMC or other evaluation report. We "started an enquiry".
- Air-leakage test, a bracing design, and a flame-spread / foam-protection argument.

Our questions

1. How do we get approved for all of Alberta?
2. Can the pilot house go ahead on a variance while we wait?
3. Do we need an engineer to stamp anything?
